

第三次Lab:

Dataflow Analysis

什么是def_use分析

- Def-Use 分析(Definition-Use Analysis)是程序分析中的一种重要数据流分析技术,用于确定程序中变量定义(def)和使用(use)之间的关系
 - 定义(Definition/Def): 对变量的赋值或写入操作
 - 使用(Use): 对变量值的读取操作
 - 示例:

```
1: x = 5 // Def of x
2: y = x + 3 // Use of x Def of y
3: x = 8 // Def of x
4: z = x * 2 // Use of x Def of z
```

Def-Use 分析会建立以下关系:

第1行的定义在第2行被使用

第3行的定义在第4行被使用

一、任务

- 本学期代码仓库: https://gitee.com/fdu-ssr/compiler2025spring
- GIR参考文档https://docs.gq.com/sheet/DTXBCSIZZS25mQnhQ?tab=urh0bh
- 本次实验需要补充compiler2025spring/lab3/code/src/lian/semantic/stmt_def_use_analysis.py
- 本次任务要求:
 - 编写指定GIR指令的def_use分析,标记指令中哪些符号被define了,那些符号被use了,包括 call_expression if_stmt array_write array_read指令

[1]

二、代码运行方式

(1) 运行scripts/lian.sh脚本

\$./lian.sh <待分析代码文件路径> -I 语言名称

例如:

./lian.sh /python/change.py -I python

(2) 运行结果为:

tests/lian_workspace/dataframe.html 将这个文件在网页中打开

/home/corgi/lianspace/lian-langapi/lianinternal/tests/lian_workspace/gir/gir_ir.bundle0

operation	parent_stmt_id	stmt_id	data_type	name	unit_id	attrs	parameters	body	target	operand
0 variable_decl	0	10		a	4					
1 method_decl	0	12		f1	4			13.0		
2 block_start	12	13			4					
3 global_stmt	13	14		a	4					
4 variable_decl	13	15		b	4					
5 assign_stmt	13	16			4				b	a
6 assign_stmt	13	17			4				a	4
7 block_end	12	13			4					
8 method_decl	0	19		%unit_init	4			20.0		
9 block_start	19	20			4					
10 assign_stmt	20	11			4				a	3
11 call_stmt	20	18		f1	4				%vv1	
12 block_end	19	20			4					
13 method_decl	0	39		append	7		40.0	42.0		
14 block_start	39	40			7					
15 parameter_dec	1 40	41		e	7					
16 block_end	39	40			7					
17 block_start	39	42			7					
18 array_write	42	43			7					
19 block_end	39	42			7					

/home/corgi/lianspace/lian-langapi/lian-internal/tests/lian_workspace/module_symbols

	module_id	symbol_name	unit_ext	lang	parent_module_id	symbol_type	unit_path
0	4	change	.py	python	0	1	/home/corgi/lianspace/lian-langapi/li internal/tests/lian_workspace/src/cha
1	5	javascript			0	12	/home/corgi/lianspace/lian-langapi/li internal/tests/lian_workspace/externs
2	6	python			0	12	/home/corgi/lianspace/lian-langapi/linternal/tests/lian_workspace/externs
3	7	pybuiltin	.ру	python	6	1	/home/corgi/lianspace/lian-langapi/li internal/tests/lian_workspace/externs

三、结果的查看方式

/home/corgi/workspace/compiler2025spring/lab3/code/tests/lian_workspace/glang/glang_bundle0

	operation	parent_stmt_i	d stmt_id	attrs	data_type	name	parameters	body	unit_id	target	operand	positional_args	receiver_object	field	source	array	inde
0	method_decl	0	10			aaa		11.0	1								
1	block_start	10	11						1								
2	assign_stmt	11	12						1	a	1						
3	assign_stmt	11	13						1	b	2						
4	assign_stmt	11	14						1	b	а						
	call_stmt	11	15			func1			1	%v0		['a']					
	field_write	11	16						1				obj1	field	3		
	field_read	11	17						1	%v1			obj2	field1			
8	assign_stmt	11	18						1	b	%v1						
9	array_read	11	19						1	%v2						arr	0
10	assign_stmt	11	20						1	С	%v2						
11	array_read	11	21						1	%v1						arr	a
12	assign_stmt	11	22						1	d	%v1						
13	block_end	10	11						1								

首先查看GIR,例如stmt_id=14的指令,在symbol_states表中,绿色列对应着当前行的index,index=4和index=5的行是stmt_id=14的GIR对应的symbol

stmt_status记录了每条指令def_use的关系,define_symbol列中记录了这条指令define了在symbol_states表中index=5的symbol,也就是"b"

/home/corgi/workspace/compiler2025spring/lab3/code/tests/lian_workspace/semantic/glang_bundle0.stmt_status

	unit_id	method_id	stmt_id	defined_symbol	used_symbols	field	operation	in_bits	out_bits
0	1	10	12	1	[0]		2	0	0
1	1	10	13	3	[2]		2	0	0
2	1	10	14	5	[4]		2	0	0
3	1	10	15	8	[6, 7]		2	0	0
4	1	10	16	12	[9, 10, 11]		2	0	0
5	1	10	17	15	[13, 14]		2	0	0
6	1	10	18	17	[16]		2	0	0
7	1	10	19	20	[18, 19]		2	0	0
8	1	10	20	22	[21]		2	0	0
9	1	10	21	25	[23, 24]		2	0	0
10	1	10	22	27	[26]		2	0	0

/home/corgi/workspace/compiler2025spring/lab3/code/tests/lian_workspace/semantic/glang_bundle0.symbols_states

1				/_												
	unit_id	method_id	stmt_id	index	symbol_or_state	symbol_id	name	states	default_data_type	state_id	state_type	data_type	array	array_tangping_flag	fields	value
	0 1	10	12	0	1					1	1	int	[]	False	{}	1
	1 1	10	12	1	0	2	a	set()		-1	0					
	2 1	100	13	2	1					3	1	int	[]	False	{}	2

	25 1	10	21	25	0	26	%v1	set()		-1	0					
	26 1	10	22	26	0	27	%v1	set()		-1	0					
	27 1	10	22	27	0	28	d	set()		-1	0					
			,													

六、编写def_use

- 本次实验用到的api有:
 - add_def_use_symbols (stmt_id, def_symbol, used_symbols, op)
 - def_symbol是该条指令被定义的符号
 - used_symbols是该条指令被使用的符号列表
 - 在使用该api时只用补充正确的stmt_id, def_symbol, used_symbol即可
- 注意事项
 - call_stmt会use函数名与参数,参数只需考虑positional_args,positional_args是一个列表,记录所有实参名
 - array_write不仅会define array(a[b]的a部分), 也会use array

参考结果-def_use关系正确即可

/home/corgi/workspace/compiler2025spring/lab3/code/tests/lian_workspace/glang/glang_bundle0

/home/corgi/workspace/compiler2025spring/lab3/code/tests/lian_workspace/semantic/glang_bundle0.symbols_states
